MG Motor India, Devnandan Gases to increase medical oxygen production

22 April 2021 | News

Increasing the production capacity by 25% in the next two weeks

MG Motor India has joined hands with Moksi-based Devnandan Gases Pvt. Ltd. to increase the production of medical oxygen. Founded in 2011, Devnandan Gases Pvt Ltd. is one of the key medical oxygen gas producers of Vadodara.

MG Motor India is focused on assisting the overall oxygen gas production. It will address specific areas of the manufacturing process such as infrastructure expansion and the elimination of major losses with lean principles.

This will help in increasing the production capacity by 25% in the next two weeks with the vision of increasing it further to 50% in the near future.

“At MG, we are committed to supporting the fight against the COVID-19 outbreak. As a part of our care for the communities around us, we are boosting the production of oxygen and providing support wherever possible. We had followed a similar approach last year and stabilized the ventilator production at Max Ventilators plant in Vadodara. Now, we are focusing on enhancing oxygen production in the region, which is the need of the hour. We would like to thank the local administration for its constant support and guidance in this initiative,” said Rajeev Chaba, President & MD, MG Motor India.

“We express our gratitude to MG for partnering for this noble cause. This collaboration will help us to scale our production as our teams work in unison to boost daily throughput. With MG Motor India’s support in debottlenecking the constraints, the initiative will go a long way in saving more lives in and around the region.” said Vijaybhai Thakkar, Owner of Devnandan Gases Pvt Limited.
