

MES Introduces smartphone app for Sperm Test in India

27 April 2018 | News

First FDA approved device to determine moving sperm

Medical Electronic Systems (MES), a Los Angeles based technology company specializing in rapid Automated Semen Analysis, has announced the launch of YO® Home Sperm Test in India, a first-of-its kind video-based smartphone platform that is FDA-cleared to measure Motile Sperm Concentration (the number of moving sperm) which is a critical factor in determining male fertility. With 97% accuracy, YO® provides consumers the ability to both view and measure the number of motile (moving) sperm in their sample on their phone and from the comfort of their home and make male fertility testing an easy process.

In order to address the problem of delayed male testing and to eliminate the stressful public nature of male sperm analysis, the YO® Home Sperm Test kit was developed by Medical Electronic Systems.

Plans are already in place by MES for YO to individually track your sperm results over time and give you a YO SCORE result. This can help to assess the success of lifestyle changes made to improve your sperm quality.
