# A new mobile app offers all clinical services

26 June 2018 | News

The ClinicAll App runs on iOS and Android devices. A central server provides full access control for all users.

The new ClinicAll App helps to make patients and hospitals independent of stationary bedside terminals. Now, clinic services can be accessed directly from any mobile device.

One of the main advantages of the ClinicAll App is integration. Several software providers have already developed clinic-specific functions but it's not feasible for users to install yet another separate app on their device for each new function.

This is where the ClinicAll App comes into play because it integrates all these functions by use of appropriate interfaces into one single app.

If you are a patient in a hospital, open the ClinicAll App on your device and login and you're ready to use TV, Internet, or retrieve all hospital information: Treatment data, your next lunch meal. You can also control room lighting and your bed.

Doctors and staff inform you via push messages about upcoming activities, dates or rounds. Nurse call is also accessible. Any communication is as easy and simple as possible.

The ClinicAll App runs on iOS and Android devices. A central server provides full access control for all users. There is no need anymore for stationary computer terminals at every patient's bedside radically decreasing cost and effort for installation.
