

NIH & Fitbit launch BYOD project

17 January 2019 | News

A second All of Us research initiative using Fitbit devices will launch in 2019

Global wearables brand, Fitbit and the National Institutes of Health (NIH) has launched the Fitbit Bring-Your-Own-Device (BYOD) project, the first digital health technology initiative for the All of Us Research Program.

Fitbit users currently enrolled in the program can now choose to sync their Fitbit accounts to help researchers unlock deeper insights into the relationships between health indicators such as physical activity, heart rate, sleep and health outcomes.

By consenting to sync their data with All of Us, Fitbit users have the opportunity to contribute to one of the world's largest precision medicine studies and help build one of the most diverse data sets for scientific research. Fitbit is the first wearable to be included in the program.

Launched nationally in May 2018, All of Us seeks to enroll one million or more participants, with the goal of improving the ability to prevent and treat disease based on individual differences in lifestyle, environment and genetics. Participants will be invited to share different types of health information over time through surveys, electronic health records, physical measurements, biosamples and digital health technologies. Data will be made accessible to researchers for a wide range of health studies, with strict safeguards in place to protect participant privacy.

Eric Dishman, director of the All of Us Research Program said, "Collecting real-world, real-time data through digital technologies will become a fundamental part of the program. This information in combination with many other data types will give us an unprecedented ability to better understand the impact of lifestyle and environment on health outcomes and, ultimately, develop better strategies for keeping people healthy in a very precise, individualized way."

As a national leader in research using digital health technologies, Scripps Research is spearheading the program's digital health effort. In 2017, Scripps Research selected Fitbit as the first wearable for use in the groundbreaking All of Us program, based on the popularity and credibility of its use in peer-validated clinical research.

Adam Pellegrini, general manager, Fitbit Health Solutions said, "This is a tremendous opportunity for Fitbit users who choose to participate, to further contribute to one of the world's largest research efforts by providing information that can help pave the way to a healthier future for all of us. Every day we learn more about the potential for wearable data to inform personalized healthcare and through All of Us, the research community will gain an even better understanding of the role wearable data can play in helping to prevent and treat disease."

A second All of Us research initiative using Fitbit devices will launch in 2019 that involves providing up to 10,000 Fitbit devices to a diverse set of participants randomly invited to take part. The study, which will be conducted by Scripps Research Translational Institute, will generate a unique data set for exploring the relationship between health indicators such as physical activity, heart rate and sleep in conjunction with other critical health outcomes that will be captured as part of All of Us.
