# Breaking the mould: 51\% females connect through Docprime's digital consultation platform 

15 May 2019 | News

Growing digital reach and health awareness is now poised to become the essence of women's empowerment

With around 5000 consultations a day, Docprime, a Policybazaar group company connected $51 \%$ women, who took the online consultation from dedicated medical consultants. This leaves the rest, $49 \%$ males taking on the digital consultation. With the underlining digital gender gap that still persists in India, this transformation seems relevant and going forward, the internet usage is expected to be more gender balanced.

The statistics reveal that between January and April 2019, medical consultancy on chat by women increased by $43.9 \%$. It is hard to ignore the significant jump (almost double) in first two \& three months of the year --- $24.4 \%$ between January \& February to $45.4 \%$ between January \& March.

Ashish Gupta, CEO, Docprime.com puts the spotlight on need and importance of technology in improving women's wellbeing. "Women, especially mothers tend to ignore their health as family becomes their priority. Providing them the digital platform like Docprime helps to break the ice as they prefer to consult a doctor while maintaining the privacy."

The statistics further reveal that of the 2 lakh consultations made by women, those under the age 18-40 years aggressively used digital consultancy as a medium to seek medical advice, with a lion's share of $82 \%$.
"Access to technology has helped in addressing the increasing health issues of women and provided a better wellbeing. Women under the age group of 40-60 years and above 60 years make up the rest, which is $18 \%$. This age bracket is more vulnerable to health related risks with limited digital literacy, which needs attention," he highlights further.

Apprehensions prevent women from seeking any medical help or openly express their problems. Technology comes to the rescue which bridges this gap and brings the privacy when it comes to health related issues for women. A quarter of the consultations revolved around mensuration \& women specific health issues, seasonal health issues and sexual wellness. Pain related problems still bother most of the women-- nearly $17.3 \%$ consultations were sought for pain related issues followed by $12.56 \%$ cases concerning pregnancy. $11.95 \%$ of the female audiences seek skin related advice

Most women under the age group of $18-25$ years seek advice regarding sexual wellness (58.7\%). Pregnancy and skin issues had a share of $51.9 \%$ and $52.1 \%$, respectively. Middle age women mostly consulted on pregnancy (46.6\%) and pain related issues ( $41.1 \%$ ). It was interesting to note that $21.8 \%$ of $40-60$ years aged women consulted for pain related problems, forcing us to revisit of our previous statement on limited digital literacy. Around $19 \%$ of their cases were related to seasonal health issues.

In this fast-paced lifestyle, people, especially women ignore their health that leads to several health complications. Connecting people by providing them the information they need to secure themselves is the need of the hour.
