

Eyestem collaborates with CCMB to fight pandemic

05 May 2020 | News

Eyestem will provide its human lung epithelial cell culture system to CCMB for further research

Under this agreement, Hyderabad based CSIR-Centre for Cellular and Molecular Biology (CCMB) will use Bengaluru based Eyestem's human lung epithelial cell culture system provided as part of its Anti-Covid screening (ACS) platform to understand the molecular and pathological characteristics of the COVID-19 virus with a view to establishing a rational basis for testing potential drugs in vitro.

Commenting on the development, Dr. Rakesh Mishra, Director of CCMB, said "Culturing the virus outside the human host is a technological challenge that needs to be overcome. Eyestem's cell culture system expresses the ACE2 receptor and other genes that are key determinants of viral entry and replication. We hope that employing this system will allow the CCMB team led by Dr. Krishnan Harshan to grow the virus predictably and thereby open up the potential for drug screening and vaccine development strategies"

Dr. Jogin Desai, CEO of Eyestem agreed and remarked "We are honoured to enter into this research collaboration with one of the premier scientific institutes in India. The ACS platform has been developed by Dr. Rajarshi Pal and his team and is a testament to our depth and expertise in cell therapy and disease modelling. We remain hopeful that CCMB will be able to leverage this platform and advance Covid research that will help humanity in India and abroad."

Eyestem was selected by the C-CAMP special COVID-19 accelerator CCIDA as a "Star for Impact" for its novel stem cell based screening platform for anti-COVID 19 drugs a week back.
