

## Roche brings blood gas digital solution for COVID-19

19 May 2020 | News

### Roche v-TAC is available in markets accepting the CE mark

Swiss firm Roche has announced the CE mark availability of Roche v-TAC, a new digital diagnostic solution that allows clinicians to obtain results for arterial blood gas values from patients with respiratory or metabolic abnormalities via a simpler, less invasive venous puncture through the use of a digital algorithm.

Blood gas analysis is typically used in hospital point of care (POC) settings, where quick and accurate results are needed. This includes emergency rooms, intensive care units and operating rooms. The analysis provides clinicians with information about a patient's pulmonary function and acid-base status, both of which are essential to make a diagnosis, provide treatment and monitor progress.

A traditional blood gas test requires the collection of an arterial blood sample, which can be a painful experience for the patient since most arteries lie deeper in the tissue than veins and have a thicker wall to be punctured. This procedure is usually carried out by medical doctors or specially-trained staff.

Through the Roche v-TAC digital solution, staff without specific training to draw arterial blood samples are now able to withdraw a venous blood sample instead and digitally convert these values into arterial blood gas values, which can help free up specialist healthcare staff to other tasks. Roche's v-TAC is fully integrated for use with Roche's cobas b 123 POC and cobas b 221 systems using the Roche cobas infinity POC solution.

"In an emergency situation such as the COVID-19 pandemic, Roche v-TAC could also help healthcare professionals to assess disease severity faster in patients and closely monitor potential deterioration in patients with respiratory compromise," said Thomas Schinecker, CEO Roche Diagnostics. "Digital tools based on clinical algorithms like Roche v-TAC can help improve and simplify delivery of care in emergency situations faster and where it is most needed."

Roche acquired the v-TAC technology at the end of March with the acquisition of Obi Medical Aps, a privately-held company based in Hadsund, Denmark that focuses on developing disruptive blood gas testing technology.
