BreatheEasy introduces self â?? sanitising KARBON face mask

29 January 2021 | News

Made from biotechnology-based patented fabric, it has been tested for wearing in different conditions; and is an ideal safety gear against airborne pathogens and the deadly virus

New Delhi based BreatheEasy Consultants has introduced the unique , self – sanitising, comfortable, Nelson labs certified KARBON face mask, which ensures that we are protected from the deadly virus with its innovative 3-layer protection.

Designed in India using premium quality material sourced from Europe and the US, the fabric is NIOSH (The National Institute for Occupational Safety and Health) tested. Made from biotechnology-based patented fabric, it has been tested for wearing in different conditions; and is an ideal safety gear against airborne pathogens and the deadly virus.

“The KARBON face mask’s inner layer comprises of high-grade imported yarn that has antimicrobial properties to ensure effective neutralisation of viruses and pathogens on contact. This makes sure that it cuts down on the chance of virus infection at the source level and helps to reduce the spread of infection,” says Barun Aggarwal, CEO, BreatheEasy.

The first layer reduces the virus effect on contact while the double-knit second layer protects one from microbial infection and cuts down on the chance of secondary infection. The third (inner) layer, made of superior grade bio-yarn, maximises protection (more than 95 per cent, better than N95 masks) against airborne pollutants for a long duration.

“The KARBON face mask is a sustainable, comprehensive and economic choice against airborne infections. Although the N95 is a popular choice since it protects against airborne infection and the deadly virus, however, it needs to be discarded after a few hours of usage and is not reusable,” adds Aggarwal.
