Indigital Technologies launches Kribado hand-held screening device

04 March 2021 | News

By using this screening machine, clinics and hospitals can triage the patients to the relevant procedures or treatments by early identification of risk as well as the degree of risk

Indigital Technologies LLP, a leading research-based technology company that is inspired by pharmaceuticals and driven by healthcare has launched Kribado, a hand-held screening device.

Kribado is the next generation behaviour setting and risk stratification device for healthcare companies and healthcare practitioners (HCP).

Kribado will assist healthcare practitioners in treating care seekers by implementing a pre-admission level. It is a non-invasive screening device that right-away analyses the patient's condition and provides a risk score while the patient is in the waiting room. By using this screening machine, clinics and hospitals can triage the patients to the relevant procedures or treatments by early identification of risk as well as the degree of risk.

Speaking about the launch of Kribado, Hiren Dhuvad, Chief Executive Officer, Indigital Technologies LLP, said, “The system is designed to eliminate the chances of data collection errors by structuring each screen, making sure it is easy to use with a consistent flow of data. Our platform is internationally adopted and simple to use. We are changing how doctors treat patients by providing seamless technology solutions for clinics and hospitals to make the experience connected, more efficient and cost effective.”

Kribado operates using AI and risk calculating algorithms trained on perfect human data. The device has a small touch-screen connected to an embedded printer. While it alerts the care providers to potential behavioural risk factors of all patients in waiting areas, it also gives each company an accurate overview of their phase IV studies, surveys and in-clinic camps.
