Globus Infocom launches AI face recognition temperature screening product

15 June 2021 | News

The access control system with an advanced temperature sensor to deny access to people with fever

lobus Infocom, an ed-tech solution provider company in the education and healthcare sector, has introduced its new AI Face recognition temperature screening product. It includes an AI face recognition temperature screening terminal for the early isolation of infected individuals. The access control system with an advanced temperature sensor to deny access to people with fever (which is one of the symptoms of viral infection).

The product comes with features like built-in temperature detection, fever warning, mask detection, etc. The temperature detecting sensors record the temperature and detect elevated temperatures without making any physical contact with the subject.
