

## IIT-M enhances wearable assistive devices with latest technologies

02 December 2021 | News

**Funded by Sony Pictures Networks India, CREATE is developing Vibe and iGest for the hearing impaired and for persons with motor disabilities**

Indian Institute of Technology Madras (IIT-M) researchers are enhancing already-developed wearable devices with the latest technologies that will assist people with hearing impairment and motor disabilities to communicate independently and enhance their quality of life. These wearable sensors will include the latest sensor technologies used in the Internet of Things.

Sony Pictures Networks India (SPNI) is supporting these projects at IIT Madras through its CSR initiatives. The devices are being developed by the Centre for Rehabilitation Engineering and Assistive Technology (CREATE), multidisciplinary translational research and educational initiative of IIT Madras.

The two major projects being developed by CREATE are 'Vibe' and iGest' for the hearing impaired and for persons with motor disabilities, respectively. Both devices are embedded systems that will bring the latest developments from IoT and ML to wearable assistive devices. Such wearable devices will have rechargeable batteries and communicate with a mobile phone over Bluetooth.

Vibe is a wearable device that vibrates for acoustic sounds around a person with a hearing impairment. Vibe features a multitude of sound patterns that are recognised using a microphone and voice recognition modules.

iGest will function as an alternative and augmentative communication device for persons with cerebral palsy. It will recognize the gestures of those with limited motor skills and convert them into audio output through a smartphone. It aims to address issues of speech impairment and motor impairments faced by persons with cerebral palsy.
