

Karkinos Healthcare, OptraSCAN to enhance digital pathology for personalised cancer care

18 August 2022 | News

Digital pathology facilitates remote consultations and second opinions to arrive at a diagnosis and initiate cancer treatment

OptraSCAN, a leading end-to-end digital pathology solution provider, today announced that Karkinos Healthcare has begun using the high-performance OptraSCAN Digital pathology platform to enhance care for their patient population. The capabilities of this digital pathology platform improve accessibility to healthcare and the distributed care model.

The demand for digital pathology has increased as healthcare institutions have struggled to overcome the challenges of the traditional care model of pathologists working in labs with physical microscopes. These workflow problems have been intensified by a shrinking pathologist population at the same time as biopsy rates have increased along with increased cancer screening options. Digital pathology facilitates remote consultations and second opinions to arrive at a diagnosis and initiate cancer treatment more rapidly.
