Ahmedabad-based CLRO Lambda Therapeutics deploys Medidata's cloud-based clinical solutions

19 April 2023 | News

Unified technology platform from Medidata to help Lambda Therapeutics leverage centralised data to address the research process from end to end

US-based firm Medidata, a wholly owned subsidiary of Dassault Systèmes, has announced that Lambda Therapeutics is implementing Medidata's cloud-based clinical solutions – Rave EDC, Rave RTSM, and Rave Imaging. This will further augment their clinical trial efficiency by automating and streamlining data management workflows, and securely delivering higher quality data for faster insights.

Lambda Therapeutics, a Clinical Research Organisation (CLRO) headquartered in Ahmedabad, has facilities and operations in North America (the USA and Canada) and Europe (London, and Warsaw, Poland). It offers a full spectrum of clinical trial solutions including Phase 2 to 4 late phase clinical efficacy and safety patient-based trials, early phase development, NCE trials, large molecule biosimilar assay development labs, data management, drug safety and pharmacovigilance and medical imaging, with more than 20 years of experience.

The implementation allows both companies to offer their global clients a single unified platform that optimizes workflows, mitigates risk, cuts development costs, and secures data integrity.

Rave Imaging's intelligent workflows simplify image and data collection and are configured to immediately perform edit checks and de-identification during the image upload process. The system then automates the distribution and review process after upload as per the protocol design.
