NURA AI health screening centre in Bengaluru to expand capacity

05 February 2025 | News

Over 20,000 individuals screened, with 1,500+ lives saved through early detection

NURA AI Health Screening, a collaboration between Fujifilm Healthcare and Dr. Kutty's Healthcare, recently celebrated the 4th anniversary of its Bengaluru facility. NURA aims to increase its capacity by 50%, enabling it to serve even more people every day. To further encourage the adoption of health screenings, NURA continues to run educational campaigns, social media initiatives, and on-ground activities, spreading awareness about the critical role of early diagnosis in saving lives.

Since its inception, the centre has screened over 20,000 individuals, identifying critical health risks and saving more than 1,500 lives through the early detection of cancer and other lifestyle-driven diseases.

NURA's Bengaluru centre utilises REILI AI technology and Pixel Shine imaging with ultra-low-dose radiation to screen multiple organs, including the lungs, liver, kidneys, heart, pancreas, and bones, ensuring a comprehensive health assessment. Starting with 5 cancer parameters, the centre has now expanded its screening capabilities to include 10 cancer parameters, with plans for further advancements in the near future.
