DHI Medical Group offers bio-exosome therapy to expand hair restoration options in India

15 July 2025 | News

Exosomes are naturally occurring, nano-sized extracellular vesicles containing bioactive molecules

Greece-headquartered DHI Medical Group, the world’s largest hair restoration company, has recently added Bio-Exosome Therapy to its comprehensive range of hair restoration treatments in India. This cutting-edge regenerative procedure utilises stem-cell-derived exosomes to naturally stimulate hair follicles, restore scalp health, and promote hair growth.

Exosome Therapy is a non-surgical, pain-free treatment that allows patients to resume their daily activities shortly after the procedure. Exosomes are naturally occurring, nano-sized extracellular vesicles containing bioactive molecules, used in various regenerative therapies, including hair restoration. This innovative method helps extend the anagen (growth) phase of the hair cycle. Clinical observations have consistently confirmed its effectiveness in increasing hair density and thickness, leading to a fuller, more natural appearance.

It is an ideal solution for individuals experiencing mild to moderate hair thinning, as well as those diagnosed with androgenic alopecia (male or female pattern baldness), alopecia areata, telogen effluvium, and diffuse un-patterned alopecia.

The Bio-Exosome Therapy experience at DHI begins with a comprehensive, patient-centric consultation. During the initial sessions, patients receive tailored recommendations and a thorough explanation of their individualized treatment plan. DHI-certified medical professionals review the patient's medical history, conduct a detailed scalp examination, and discuss expectations and desired results.

Using advanced diagnostic technology, DHI scans both the recipient and donor areas of the scalp to collect precise data and formulate a personalised treatment strategy. Patients are supported throughout every phase of the process, from pre-procedure preparation to post-procedure recovery and long-term maintenance.

Bio-Exosome Therapy is currently available at all authorised DHI India clinics, including those located in Delhi, Gurgaon, Noida, Chennai, Bangalore, Kolkata, Hyderabad, Guwahati, Chandigarh, Kochi, Lucknow, and Kozhikode.
