

Healthcare AI platform NPrep raises funding to address nursing education crisis

07 August 2025 | News

NPrep is tackling a critical challenge in India's healthcare system- the lack of quality nursing education

NPrep, a placement-focused company which is building an artificial intelligence (AI)-powered skilling platform for nursing students and professionals, has raised an undisclosed amount in a pre-seed funding round led by All In Capital.

The round also saw participation from IIMA Ventures, Chegg's founder Aayush Phumbhra (American educational technology company) as an investor, and several family offices and angel investors. One of the most significant early-stage raises in India's nursing and healthcare skilling industry.

NPrep will use the capital to expand its course offerings, strengthen and build its AI-driven learning platform, and deepen its placement partnerships with hospitals and healthcare institutions across India. The startup also plans to invest in growing its regional language support to better serve students from Tier 2 and Tier 3 cities.

The startup aims to address this by offering an AI-powered skilling and placement platform tailored to the specific needs of nursing students and professionals. The platform aims to use generative AI to personalize learning paths based on a student's strengths and weaknesses, simulate real-world clinical scenarios for superior skill training, and provide instant feedback. It will also support students through mock interviews, resume building, and automated assessment tools that help improve their job readiness.

By combining technology with tailored support, the startup aims to strengthen the nursing workforce and improve healthcare delivery across the country. Looking ahead, the company plans to expand its placement services domestically in FY26 and internationally by FY27, building on its foundation of medical and technological expertise.
