Even Hospital partners with Canara Surgicals to improve minimally invasive surgeriesâ?? outcomes

14 May 2026 | News

Enabling better clinical outcomes with precision laser technology

Even Hospital, a Bengaluru-based multi-speciality hospital, has collaborated with surgical-tech firm Canara Surgicals to introduce the latter's laser technology-based medical devices facilitating minimally invasive surgeries.

As a part of this long-term collaboration toward surgical equipment supply and deployment, Mumbai-based startup Canara Surgicals has deployed its medical-grade Angelas diode laser, calibrated at 1470 nm wavelength, at Even Hospital's state-of-the-art facility located on Race Course Road, Bengaluru.

The cutting-edge laser-tech device – which shall be used across multiple specialties/departments of Even Hospital, including vascular, interventional radiology, proctology, ENT, cosmetic, and gynaecology – enables a range of procedures such as endovenous ablation of varicose veins, haemorrhoidectomy (for treating piles), percutaneous laser disc decompression (PLDD) for spinal conditions, among other microsurgeries.

Unlike traditional surgical methods that involved large incisions and longer recovery periods, modern procedures powered by laser technology and fibre-optics allow today's surgeons to operate with greater precision and minimal tissue disruption. Laser-tech based minimally invasive surgeries are proven to not only reduce bleeding and post-operative pain, but also to minimise chances of recurrence.

Canara Surgicals – which has obtained approval from the Central Drugs Standard Control Organization (CDSCO) for supplying its medical equipment across India – has been working closely with several reputed hospital chains of the country.
