Mykare.ai raises \$3.2 M to address healthcare accessibility and gaps

30 June 2026 | News

Mykare has expanded across the United States, United Kingdom, Middle East, and India

Bengaluru-based startup Mykare.ai has raised a total of \$3.2 million, including an additional \$1 million in its latest funding round. The round included participation from Andrew and Alfredo, founders of Papa.com, and a leading family office from the Middle East.

At a time when investors are pouring billions into AI startups promising to revolutionise healthcare with futuristic technologies, Mykare.ai is focused on a far more fundamental problem: helping clinics and hospitals improve patient access, engagement and overall experience through better operational efficiency.

The startup is building an AI-native healthcare operating system that helps clinics and hospitals grow by automating the entire patient journey, from patient acquisition and appointment booking to follow-ups, feedback, and retention.

Founded by Senu Sam, Mykare.ai aims to help healthcare providers scale with a single intelligent AI layer that works across fragmented systems. Its AI agents can acquire new patients, identify patient intent, answer calls through voice agents, book appointments, manage follow-ups, collect feedback, and automatically update CRM records, creating a unified patient journey.

Mykare has expanded across the United States, United Kingdom, Middle East, and India, and currently has a waiting list of more than 20 hospitals and healthcare providers.

The new funding will be used to enhance Mykare's AI capabilities, accelerate product development, and support global expansion.
