Forus Health unveils portable digital eye clinic

13 July 2026 | News

Combining portable diagnostics, digital workflows, and artificial intelligence

Forus Health, a Bengaluru-based health technology company focused on transforming eye care through innovation, has announced the launch of FH Eyepal, a portable Digital Eye Clinic that enables healthcare providers to deliver comprehensive eye examinations beyond conventional hospital settings.

Developed to make quality eye care more accessible, FH eyepal transforms virtually any location into a fully equipped eye screening clinic within minutes.

Designed as a compact, portable solution, it can be deployed across primary healthcare centres, community health programmes, corporate wellness initiatives, vision camps, and home based care, bringing quality eye care closer to the people who need it.

Powered by FH POISE, Forus Health's proprietary artificial intelligence (AI) platform, retinal images are analysed instantly to identify potential abnormalities and support timely clinical decision making. By combining intelligent diagnostics with a connected digital workflow, FH eyepal helps improve screening efficiency, enables early detection of eye conditions and supports better continuity of care.

Designed for flexible deployment across diverse healthcare settings, FH eyepal empowers healthcare providers to expand screening programmes, improve operational efficiency and deliver specialist-quality eye care to every community without the need for permanent clinical infrastructure.
