A new Digital Radiography System by CURA

Chennai-based CURA Healthcare has launched a DReam Digital Radiography system, a revolutionary product. This is the company's patent design system.

DReam offers a unique single detector design that can be used in any position, all without moving the detector. It comes with flat panel technology, providing high image quality. Radiation emitted by DReam is very low, ensuring patient safety especially for pediatric patients as it emits 25-50 percent lesser radiation as compared to other systems. It is a lifesaving system for emergency, trauma, and accident cases and has a very high patient throughput of upto 300 patients per day

Mr Balasubramaniam, CEO, CURA Healthcare said, "The entire concept of going digital makes the process quick and very efficient. With such technological advancements, services provided are better with accurate results. The new Digital Radiography technology is superior, cost effective, and much healthier than the existing technologies available for both patients and radiologists. CURA aims to bring in such ground-breaking technology accessible to everyone and change the medical healthcare scenario for the better."

CURA is also taking DReam, and other such medical equipment and instrument solutions to smaller towns to provide the right healthcare. It is bridging the gap in medical treatment by bringing in products that are low-cost but effective in rural areas.
