NIP to organise In-situ hybridization workshop

The workshop being organized at the Safdarjung hospital Delhi campus by NIP, an Indian Council for Medical Research institute, is intended for medical and biomedical faculty and students to become conversant with this technique and apply the knowledge in their respective fields. It is tailored in such a way that the participants will get hands-on experience about the old elaborate method of doing in-situ hybridization as well as the new advanced method of fluorescent in-situ hybridization (FISH).

In addition, theoretical concepts will be provided through lectures and discussions to facilitate the learning process. The main objective of this course is to equip the candidates with an understanding of concepts pertaining to in-situ hybridization and FISH and hands-on experience for its application in various fields.

In-situ hybridization including FISH is an important research tool which has made strong inroads into diagnostic pathology in recent years. It has an important diagnostic and prognostic value in oncology where it is used to detect cytogenetic and chromosomal abnormalities in various tumors. It is also applied for detection of various infective agents like viruses and bacteria.
