Clinovo launches latest version of ClinCapture

With the new release of Electronic Data Capture (EDC) system ClinCapture, sponsor companies, contract research organizations (CROs) and researchers will be able to streamline the development and management of clinical trials by creating and managing electronic case report forms (CRFs) without relying on professional services.

"We are very proud of this new release, which will deliver unprecedented speed of implementation, flexibility and functionality to users," said Mr Glenn Keet, CEO, Clinovo. "The new features will give users the ability to create CRFs without having any sort of advanced programming or IT management skills, which represents a great leap forward in terms of usability for the industry."

ClinCapture is cloud-based, hence users can manage one or several clinical trials from anywhere, at any time.

Designing and creating CRFs will be faster and more straightforward with the drag-and-drop amenities, not to mention complex edit checks creation made simple-clinical trial managers can have these necessities completed in just a few days, making the processes extremely cost effective.

"The self-service portal sets ClinCapture apart from other EDCs," said Mr Marc Desgrousilliers, CTO, Clinovo. "Efficiency is essential in this industry, and having everything you need to build CRFs at your fingertips is exceptional. ClinCapture is also the only open source EDC with an integrated, intuitive randomization function and is one of the only WHO drug certified EDCs -proving Clinovo's technological leadership."
